

Computer Vision :

Eye Detection Problem:

Do to detect the eye from the given set of images.

Ans : In order to detect the eye from the images. We need to first preprocess the image.

1. Convert the image to grayscale using `rgb2gray(img);` function.
2. Then adjust the contrast of the image using `imadjust()` matlab function;
3. Now you can use `detectFriskFeatures()` or `im FASTFeatures` to detect the strongest 2 points from the image and return them to our main function.
